PRODUCTS PLUS FULL-SERVICE

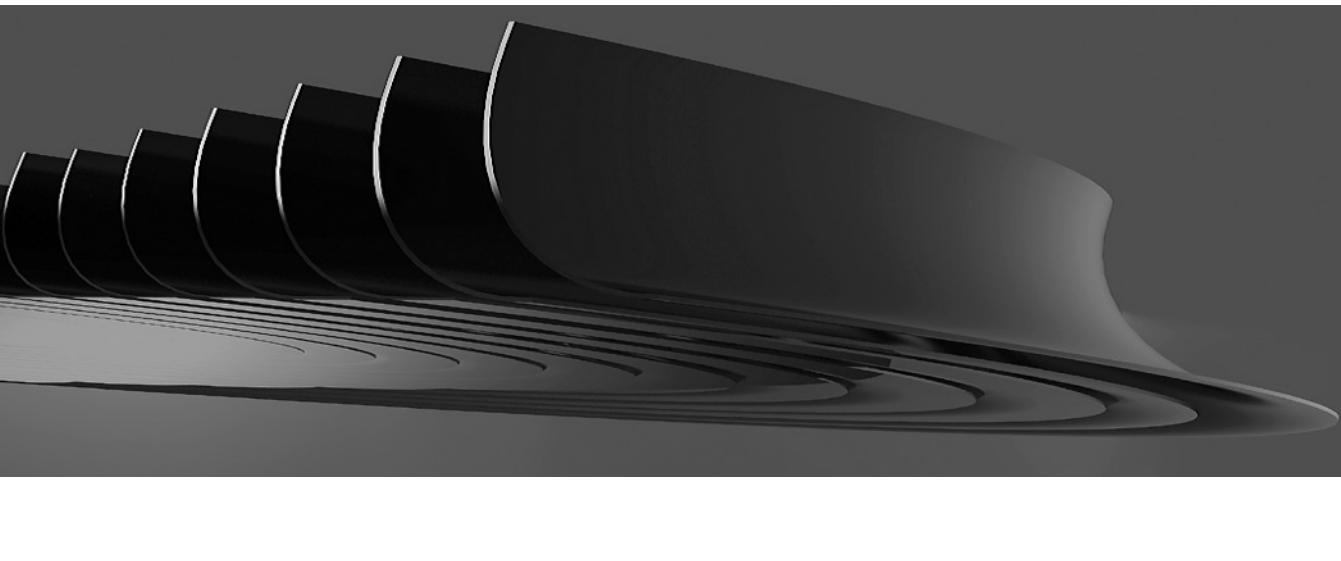

The Trademark Pollrich DLK Fan Factories®

The trademark “Pollrich DLK Fan Factories” stands for **more than 40 years of production know-how of industrial fans**. DLK Ventilatoren GmbH in Schöntal-Berlichingen / Germany manufactures with a workforce of more than 100 employees axial and centrifugal fans for nearly any industrial application.

As **the only manufacturer in the world offering all five product segments of industrial fans**, we propose an unmatched range of products for the most different requirements of our customers. As our sales teams are organised in market segments they will better understand the specific project of their customer and supply knowledgeable solutions.

With a mix of standardisation, sophisticated variant management, tight internal organisation, and an intelligently controlled staff employment, we manufacture as well **standard fans as pinpointed special units** – always precisely matching the customer's requirements, including highest efficiency, zero-defect and shortest delivery time.

Our R&D department combines expertise within all sectors of fan technology with highly efficient simulation tools such as CFD (Computational Fluid Dynamics) for flow visualisation and FEM (Finite-Element-Method) to calculate the structure-mechanical characteristics, as well as test ducts and -chambers according to international standard ISO 5801, equipped with the latest measuring technology in order to determine the aerodynamic and aeroacoustic characteristics.

Our company's commitment is centered to high quality and customer's needs. Our understanding for quality is not limited to the product and to the production methods certified according to DIN ISO 9001. Our quality commitment includes the results of the individual work of every employee. This is the philosophy that every employee is realising towards inside and outside of the company. Products and management processes are consistently adjusted to the customer's requirements by applying Kaizen/CIP. This means for our customers: Qualified advice and support, innovative product solutions, reliable delivery times and unvarying high product quality.

We take care of you, wherever you are in the world, with our comprehensive power service package beginning at the moment of feasibility or project studies, passing by the commissioning on site, and ending in a first class after sales service. Our **worldwide acting service team** will be ready to help every day of the year for 24 hours.

Project planning advice

Sound calculations

This section first looks at the theoretical principles required to calculate sound. It then goes on to explain how the sound calculations are carried out at PollrichDLK.

Theoretical principles

Sound pressure

Sound pressure waves are small pressure fluctuations that are masked by the ambient pressure. Due to the fact that the sound pressure in the normal pressure unit Pa exceeds several powers of 10, it is usually stated as the sound pressure level in a logarithmic form in the unit decibel [dB]:

(1)

$$L_p = 10 \cdot \lg \left(\frac{p_{\text{eff}}^2}{p_0^2} \right)$$

In (1) the reference value corresponds to the lower hearing threshold.

A sound pressure level of e.g. 8 dB therefore corresponds to 108/10 times the lower hearing threshold. This correlation is shown by the examples in Table 1

Table 1: Correlation between the sound pressure and sound pressure level based on examples

Sound sources	Distance in m	Sound pressure p in Pa	Sound pressure level Lp in dB
Jet plane	30	200	140
Pain threshold		63,2	130
Discomfort threshold		20	120
Chainsaw	1	6,3	110
Disco loudspeaker	1	2	100
Diesel engine	10	0,63	90
Busy road	5	0,2	80
Vacuum cleaner	1	0,063	70
Normal speech	1	0,02	60
Home		0,0063	50
Quiet library		0,002	40
Quiet bedroom		0,00063	30
Background in a TV-studio		0,0002	20
Hearing threshold		0,00002	0

The sound pressure level depends on the distance rL to the sound source and decreases as the distance increases in the ratio:

(2)

$$p_{\text{eff}} \approx \frac{1}{r_L^2}$$

A sound usually contains sounds of different frequencies. Therefore it makes sense to present sound as a range that is dependent on the frequency. Figure 1 shows a so-called narrow band spectrum. In this, the broad-range basic noise is often masked by the striking sounds reflected in the various single frequency peaks.

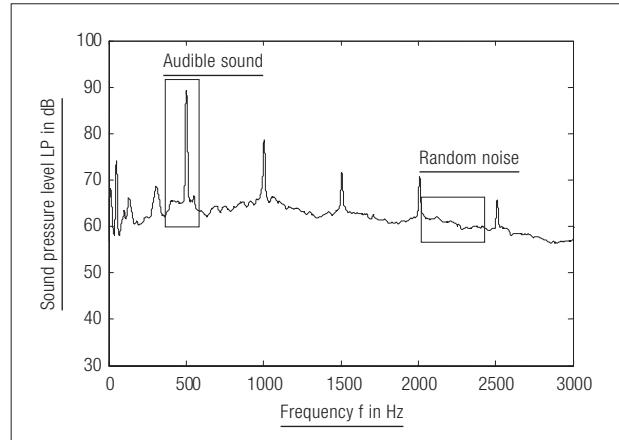

Figure 1: Narrow band spectrum - sound pressure level

In practice, the narrow frequency bands are often summarised into octave bands that are defined in DIN EN 61260. This results in an octave band spectrum, Figure 2. The middle frequencies of the octave bands are 63, 125, 250, 500, 1000, 2000, 4000 and 8000 Hz. To calculate an octave band spectrum, all narrow band sound pressure levels Lp within an octave band Δf_{Oktav} are added up:

$$L_{p,\text{Oktav}} = 10 \cdot \lg \left(\sum_i 10^{\frac{L_{p,i}(\Delta f_{\text{Oktav}})}{10}} \right) \quad (3)$$

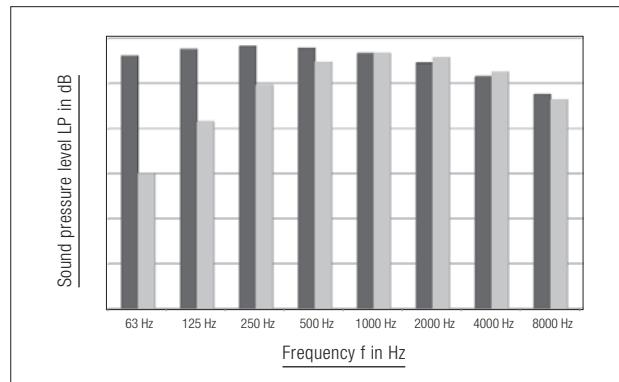

Figure 2: Octave band spectrum - sound pressure level non-weighted and A-weighted

Sound power

In contrast to the sound pressure level, the sound power level LW does not depend on the distance to the sound source. To determine the sound power level, the sound pressure level is first determined at several points on the enveloping surface A around the fan; this is then summarised according to frequency in a mean octave band spectrum:

$$L_{p,m} = 10 \cdot \lg \left(\frac{1}{j} \sum_{i=1}^j 10^{\frac{L_{p,\text{Oktav},i}(f)}{10}} \right) \quad (4)$$

The mean sound pressure level is converted to the sound power level in the octave spectrum by means of the enveloping surface unit L_s:

$$L_w = L_{p,m} + L_s \quad (5)$$

Project planning advice

The enveloping surface unit is determined in (6) as follows:

$$L_s = 10 \cdot \lg \left(\frac{A}{A_0} \right) \text{ mit } A_0 = 1 \text{ m}^2 \quad (6)$$

The k octave bands can be summarised to a total sound power level $L_{W,tot}$ by means of logarithmic addition for all mean frequencies:

$$L_{W,ges} = 10 \cdot \lg \left(\sum_{j=1}^k 10^{\frac{L_{W,j}}{10}} \right) = 10 \cdot \lg \left(10^{\frac{L_{W,03Hz}}{10}} + \dots + 10^{\frac{L_{W,8000Hz}}{10}} \right) \quad (7)$$

A-weighting

The A-weighting is a relativisation that takes into account the characteristics of the human ear (unit dB(A)). To determine an A-weighted octave spectrum, the level corrections shown in Table 2 are added to the non-weighted spectrum:

$$L_{p,A} = L_p + L_{A\text{-Assessment}} \quad (8)$$

Table 2: A-weighted - level correction $L_{A\text{-weighted}}$

63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz
-26,2	-16,1	-8,6	-3,2	0	+1,2	+1,0	-1,1

Comments

To calculate the sum of several sound sources, the individual levels are added logarithmically:

$$\begin{aligned} L &= 10 \cdot \lg \left(\sum_{i=1}^k 10^{\frac{L_i}{10}} \right) \\ &= 10 \cdot \lg \left(10^{\frac{L_1}{10}} + 10^{\frac{L_2}{10}} + \dots + 10^{\frac{L_k}{10}} \right) \end{aligned} \quad (9)$$

When two sound sources of the same level of noise are added, the sound value always increases by 3dB regardless of the sound level.

The enveloping surface is usually either a spherical surface

$$A = 4 \cdot \pi \cdot r^2 \quad (10)$$

or a hemispheric surface

$$A = 2 \cdot \pi \cdot r^2 \quad (11)$$

Calculation and measurement at Pollrich DLK

If there are no sound measurements from the sound laboratory, PollrichDLK carries out a calculation based on the VDI 3731. The guideline divides the continuous flow machines into the following fan types:

- Axial with guide vane
- Axial without guide vane
- Centrifugal middle pressure
- Centrifugal high pressure

In these sound calculation methods, the sound power level is first estimated based on the aerodynamic data. Then, based on this, the octave spectrums and then a sound pressure level are determined. The method is applied equally for all fan types, however machine-specific coefficients are used:

- Calculation of the non-weighted sound power level (is the same for cable connections on the suction and pressure side except for high-pressure centrifugal fans)

$$L_w = C_1 + 10 \cdot \lg \left(\frac{p_r \cdot q_v}{p_o \cdot q_{v,o}} \cdot \left(\frac{1}{\eta_a} - 1 \right) \right) + 10 \cdot C_2 \cdot \lg \left(\frac{u_2}{a} \right) \quad (12)$$

- Calculation of the A-weighted sound power level

$$L_{w,A} = C_3 + 10 \cdot \lg \left(\frac{p_r \cdot q_v}{p_o \cdot q_{v,o}} \cdot \left(\frac{1}{\eta_a} - 1 \right) \right) + 10 \cdot C_4 \cdot \lg \left(\frac{u_2}{a} \right) \quad (13)$$

- Estimation of an octave spectrum using a fan-specific value $\Delta L_{w,okt}$ (ST) for every octave band

$$\Delta L_{w,okt} (\text{St}) = - \left[C_5 + C_6 \cdot (\lg(\text{St}) + C_7)^2 \right] \quad (14)$$

with the Strouhal number

$$St = \frac{f \cdot D}{u_2} \quad (15)$$

and addition to the sound power level acc. to Gl. (16) bzw. (17)

$$L_{w,okt} = L_w + \Delta L_{w,okt} (\text{St}) \quad (16)$$

$$L_{w,A,okt} = L_{w,A} + \Delta L_{w,okt} (\text{St}) \quad (17)$$

Calculation of the sound pressure level for a hemispherical enveloping surface

$$L_{p,okt} = L_{w,okt} + 10 \cdot \lg \frac{1}{2 \cdot \pi \cdot r^2} \quad (18)$$

- the A-weighting

$$L_{w,A,okt} = L_{w,okt} + \Delta L_{A\text{-Assessment}} \quad (19)$$

- Calculation of both the non-weighted and also the A-weighted total sound pressure level by means of logarithmic addition of the individual values of the octave band acc. to eq. (17).

The values for C1 to C7 are either taken from the standard or adapted accordingly to internal measuring values.

Project planning advice

Explosion protection

Fans may only be used in areas in which there may be explosive media if they have been manufactured in compliance with the Directive 94/9/EC. The principles of this Directive are shown below.

Theoretical principles

Apart from the CE (€) and the so-called ATEX symbol (Ex) devices are also labelled with information about the device group, device category, type of protection, explosion subgroup and temperature class, Figure 3.

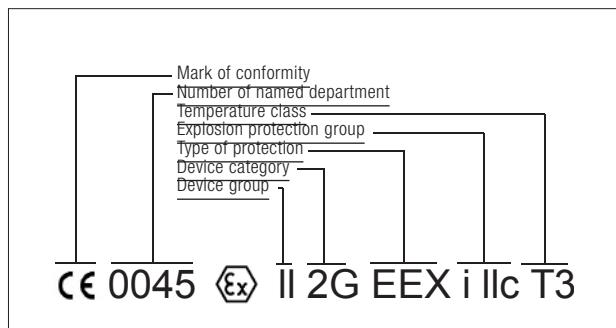

Figure 3: Device identification acc. to the Directive 94/9/EC

The classifications mentioned are explained in the following sections.

Device groups

Machines for use in explosion-protection areas are divided into two groups:

1. **Group I** only applies to mining
2. **Group II** applies to all other explosion-protection areas.

Zone division

Group I is divided into two sub-groups and is shown Table 3

Table 3: Categories of the device group I

Device group I (mining)			
	Category M1: Very high level of security	Category M2: High level of security	
Adequate security	Constant, long-term or frequent	Occasionally in normal operations	

The classification of the device group II into appropriate categories is somewhat more complex and is shown Table 4.

Table 4: Categories of the device group II

Device group II other explosive areas						
	Category 1: Very high level of security	Category 2: High level of security	Category 3: Normal level of security			
Creation of dangerous atmosphere (gas, dust)	Constant, long-term or frequent	Occasionally in normal operations	Not for normal operations, or only briefly			
Use in zone:	0	20	1	21	2	22
Atmosphere G=gas, D=dust	1G	1D	2G	2D	3G	3D

Types of protection

The type of protection shows the technical action taken to ensure the machine cannot act as an ignition source. Table 5 shows what action can be taken so that non-electrical components can be used in explosion-protection areas acc. to EN 13463-1 ff (non-electric).

Table 5: Types of protection for non-electrical components acc. to EN 13463-1 ff

Types of protection	Abbreviation	Category
Vapour-retarding encapsulation	Ex fr	II 3G
Pressure-resistant capsule	Ex d	II 2G II 2D II 3G II 3D
Constructive safety	Ex c	II 2G II 2D II 3G II 3D
Monitoring of ignition sources	Ex b1 Ex b2	II 2G II 2D II 3G II 3D
Over-pressure encapsulation	Ex p	II 2G II 2D II 3G II 3D
Liquid encapsulation	Ex k	II 2G II 3G

For a complete list of the types of protection, please refer to the Directives EN 60079-0 ff, EN 13463-1 ff and EN 61241-0 ff.

Explosion-protection groups

The explosion-protection groups state the materials that the machine may come into contact with. Two protection groups need to be defined for the machine - one for the fan and the other for the motor compartment. The classification of typical gases is shown in Table 6. The classification of further gases and dust common in the industry is listed in the Directive 94/9/EC.

Table 6: Explosion protection groups

Explosion protection groups	
Explosion protection group	Typical gas
I	Methane
II A	Propane
II B	Ethylene
II C	Hydrogen

Temperature classes

The temperature class specifies the highest allowed surface temperature of the machine. The division of the classes is shown in Table 7.

Table 7: Temperature classes

Highest allowed surface temperature	Temperature class acc. to: CENELEC IEC USA (NEC 505)
450 °C	T1
300 °C	T2
200 °C	T3
135 °C	T4
100 °C	T5
85 °C	T6

Project planning advice

The temperature classes are selected like the classification of the explosion protection types depending on the material used and are also stated in the Directive 94/9/EC or corresponding tables.

Identification in dusty atmosphere

When fans are used in a dusty atmosphere the identification has to be changed. The explosion protection group is not used anymore. The temperature class is replaced by the maximum surface temperature.

CE 0045 Ex II 2D EEX i T125°C

Similarity laws

This section looks at the similarity laws that serve the conversion of the measuring data for changed operating conditions.

If two machines have a geometrical - strictly speaking also kinematical and dynamic - similarity, their operating data can be mutually converted. 2 machines are geometrically similar if all geometric dimensions can be mutually converted by means of multiplications with a constant factor. Angles, such as e.g. the blade angle, are the same for geometrically similar machines.

This means that the data of a fan can be converted to another impeller diameter, another numbers of revolution or another density of the flowing fluids.

The following ratios for the conversion of volume flow , pressure increase and shaft output can be derived from the dimension analyses (the index "old" designates the known initial factors, the index "new" stands for those factors that still have to be determined):

Volume flow

$$q_{V,new} = \left(\frac{D_{new}}{D_{old}} \right)^3 \cdot \left(\frac{n_{new}}{n_{old}} \right) \cdot q_{V,old} \quad (20)$$

The change in the diameter of the impeller affects the required volume flow to the power of 3, a change of speed is linearly proportional to the volume flow. A change in density does not affect the volume flow.

Pressure increase

$$\Delta p_{f,new} = \left(\frac{D_{new}}{D_{old}} \right)^2 \cdot \left(\frac{n_{new}}{n_{old}} \right)^2 \cdot \left(\frac{\rho_{new}}{\rho_{old}} \right) \cdot \Delta p_{f,old} \quad (21)$$

The increase in pressure depends on the square of the change of the diameter and the number of revolution respectively. Density changes are linear.

Shaft output

$$P_{a,new} = \left(\frac{D_{new}}{D_{old}} \right)^5 \cdot \left(\frac{n_{new}}{n_{old}} \right)^3 \cdot \left(\frac{\rho_{new}}{\rho_{old}} \right) \cdot P_{a,old} \quad (22)$$

The recorded shaft output of a fan depends heavily on its diameter (to the power of 5). Changes in speed are stated to the power of 3, density changes are linear.

Apart from the conversion to other construction parameters, these formulas are often used to make measurements comparable regardless of the test conditions. To this end, the results are standardised to an air density of $\rho = 1.2 \text{ kg/m}^3$. An example of a conversion of given data to a standard density is shown in the chapter "Units and conversion factors".

The number of revolution is converted when a frequency converter (FU) is used, when there are differing pole numbers for the drive motor or different network frequencies. If there are slight changes to the operating status, these conversions are sufficient, if there are large changes of diameter or number of revolution, changes to the efficiency level need to be taken into consideration as a result of the so-called Reynolds number influences. This is usually carried out by means of upgrading equations.

System characteristics, performance curves and operating behaviour in the event of flow disturbances

The system characteristic is a system-specific parameter that describes the pressure loss of the entire system. The pressure loss of a system depends on the density of the flow medium, the flow speed and a specific loss coefficient ξ .

For many fittings such as manifolds, vanes, rectifier or throttles, there are empirically determined loss coefficients in various literature publications that can be used to calculate the system pressure loss. The pressure loss for straight flows through pipes and channels is determined by means of a pipe friction coefficient λ .

The total pressure loss of a system is calculated as the sum of the individual losses as follows:

$$p_s = \sum_{i=1}^1 \xi_i \frac{\rho}{2} c_i^2 \quad (38)$$

The fan characteristic is measured on a standardized test rig under optimised flow conditions. Figure 6 shows the schematic sketch of a corresponding chamber test stand. The system losses are simulated by means of a controllable throttle.

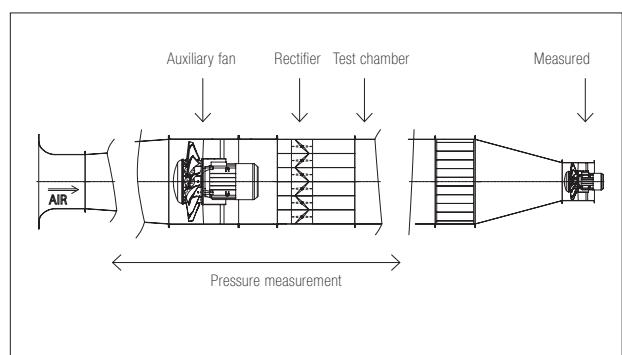

Figure 6: standardized test rig (according to ISO 5801)

The operating point of a fan is the point where the system characteristic intersects the fan characteristic (see Figure 7).

Project planning advice

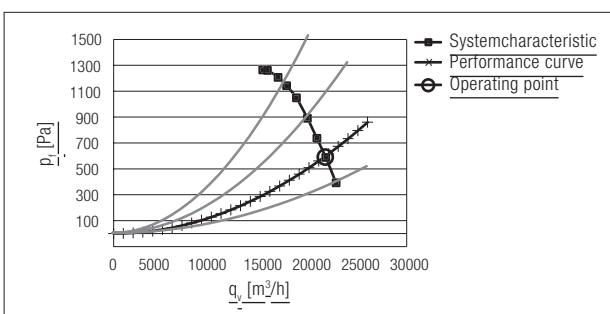

Figure 7: Operating point as the intersection of the system and performance curves

Ignored or inadequately considered influences that change the system pressure loss and therefore change the flow behaviour lead to a change in the system characteristic and therefore also shift the operating point. Also, they can cause an uneven velocity field at the inflow and outflow intersection of the fan which can excite the impeller into damaging vibrations.

PollrichDLK has a large number of studies relating to the fittings on the intake and pressure sides. Figure 8 shows various inflows. The use of an inflow nozzle is ideal (Figure 8a). Sharp-edged cross-section changes (Figure 8b and 8c) will mean that the flow cannot follow these and will create a swirl that prevents homogeneous inflow.

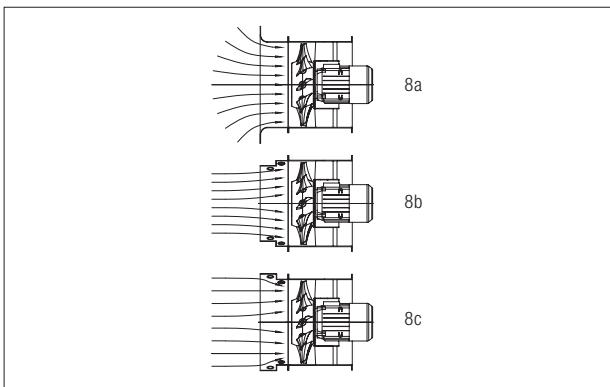

Figure 8: Example of inflows to the impeller

Steps should be taken to ensure the disturbance-free inflow and outflow of the impeller. There must be an adequate distance between the fan and the fittings.

Detailed information about the installation situation is a prerequisite for the adequate installation of the fan.

Units and conversion factors

Length dimensions

Apart from the SI units, the following other length units are also used in the engineering field:

- Foot/feet, 1 ft = 12 in = 0.3048 m.
- Mile; (usually terrestrial mile) of the USA, 1 mile = 1.609344 km.
- Yard, 1 yard = 3 ft = 36 inches = 0.9144 metres
- Inch 1 in = 1" = 2.54 cm = 0.0254m

Radian

Angles can either be stated in radians (angle in relation to π) or in degrees. 180° degree correspond to a radian of π . Important radians are shown in Table 9.

Table 9: Conversion radian and degrees

	$1/4 \pi$	$1/2 \pi$	$3/4 \pi$	1π	$5/4 \pi$	$3/2 \pi$	$7/4 \pi$	2π
0°	45°	90°	135°	180°	225°	270°	315°	360°

Pressure

Depending on the geographical region and the industrial background, the pressure is often stated in various units. The conversion can be carried out using the unit Pa = Pascal based on the Table 10 and 11. Here the following applies: mmHg = mm mercury column, mmWS = mm water column, inWS = Inch water column and PSI = pounds per square inch.

Table 10: Pressure conversion in Paschal

Unit	in Pa
1N/m^2	1
1N/mm^2	$1,0\text{E-}6$
1mmWS	9,8066
1Inch WS	249,1
1mmHg	133,322
1bar	$1,0\text{E}5$

Table 11: Pressure conversion from Pascal

Unit	in Pa
1Pa	1N/m^2
1Pa	$1,0\text{E}6\text{N/mm}^2$
1Pa	$0,10197\text{mmWS}$
1Pa	$4,015\text{E-}3\text{Inch WS}$
1Pa	$7,501\text{E-}3\text{mmHg}$
1Pa	$1,0\text{E-}5\text{bar}$

Rotational speed in peripheral speed

(35)

$$u_{1,2} = 2\pi n r_{1,2} = \pi n D_{1,2}$$

Conversion of operating density to reference density

The measured results depend on the air density in the environment and the test rig. These influences are eliminated by conversion to a reference density. Usually the reference density is defined as $\rho_B = 1,2 \text{ kg/m}^3$. The actual density during measuring is $\rho = 1,15 \text{ kg/m}^3$. For a measured pressure increase of $p_f = 1000 \text{ Pa}$ and an impeller output of $P_a = 10 \text{ kW}$, the result is the following conversion according to the Gl. (36) and (37):

$$\rho_{f,new} = \frac{\rho_B}{\rho} \rho_f = \frac{1,2}{1,15} 1000 \text{ Pa} = 1043 \text{ Pa}$$

(36)

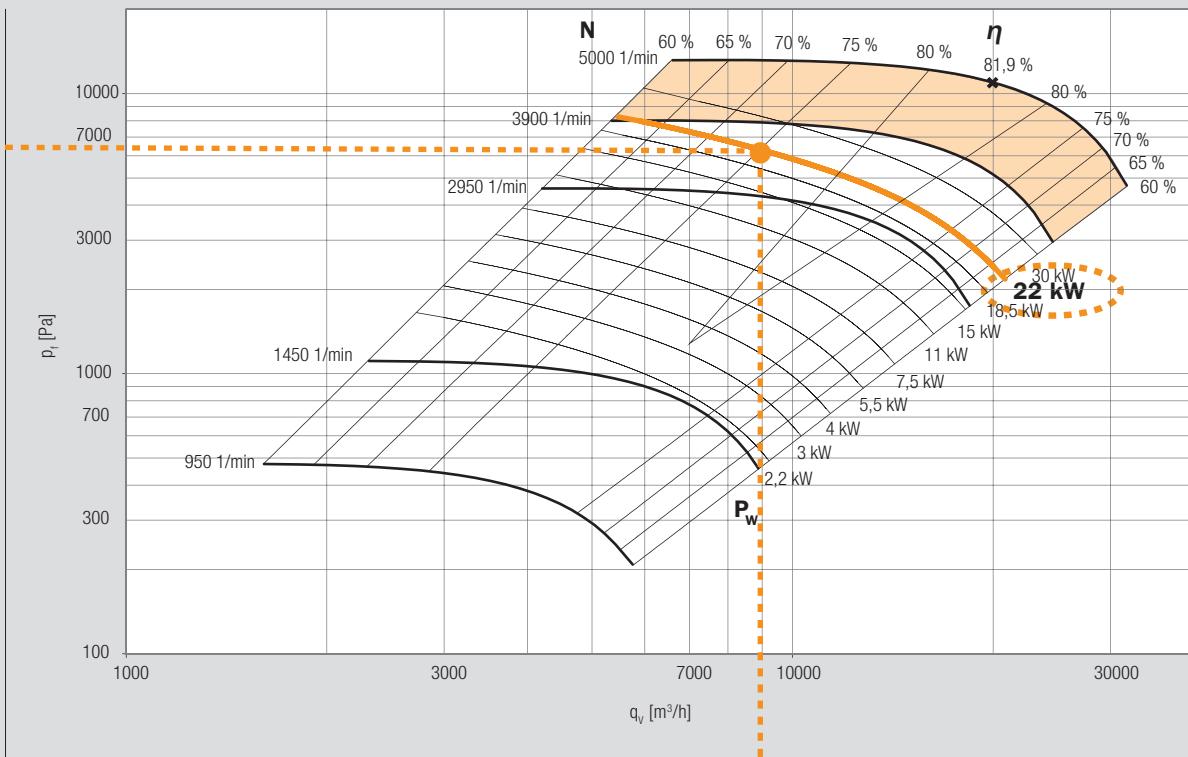

$$P_{a,new} = \frac{\rho_B}{\rho} P_a = \frac{1,2}{1,15} 10 \text{ kW} = 10,43 \text{ kW}$$

(37)

The volume flow remains unchanged.

Characteristic Determination:

CREM01-56-0560

Example:

1. Desired duty point $q_v = 9000 \text{ m}^3/\text{h}$; $p_f = 6500 \text{ Pa}$.
2. Select performance that is above the duty point.
Example **22 kW**.
3. Input the selected motor power and read the corresponding order number from the table.
Here this is: **B100842**
4. Use inverter drive if the duty point is not close to a standard rotational speed.

CREM01-56-0560-B

POLLRICH DLK[®]
FAN FACTORIES

Centrifugal fans
clutch- and belt driven

... you should get to know!

CENTRIFUGAL FAN CREM

28-71 / 400-1400

Application:

The direct driven compact centrifugal fans of product group CREM (Etatec by Pollrich DLK) can be used for extraction and supply of clean and slightly dusty air for various applications.

The main advantages:

- Aerodynamically optimized impellers
- Wide range of accessories
- High efficiency through wide product portfolio with 9 variants per impeller diameter
- Compact design
- Robust design
- Easy installation
- Large increases in pressure as well as high volume flows
- Customized solutions

Permissible flow temperature:

-20 to + 80 °C. Higher operating temperatures to 300 °C on request.

Casing:

Step welded spiral casing with inlet cone in mild steel or stainless steel. Optimum corrosion protection by powder coating (RAL 7015).

Optional: Hot-dip galvanizing , special coating , fully welded.

Impeller:

High performance radial impeller , single inlet , backward curved blades.

Standard, in mild steel or stainless steel. Dynamically balanced to DIN ISO 1940-1 grade G 6.3 <4 mm / s
Optimum corrosion protection by powder coating (RAL 7015).

Optional: Increased speed with high strength materials.

Drive:

Three-phase motor, IP55, insulation class F, IE2, up to and including 3 kW: 230V/400V, 400V/690V from 4 kW upward. Coolant temperature at motor max. 40 °C.

Thermistors wired to the motor terminal box.

Optional: Custom motor specification.

Output adjustment:

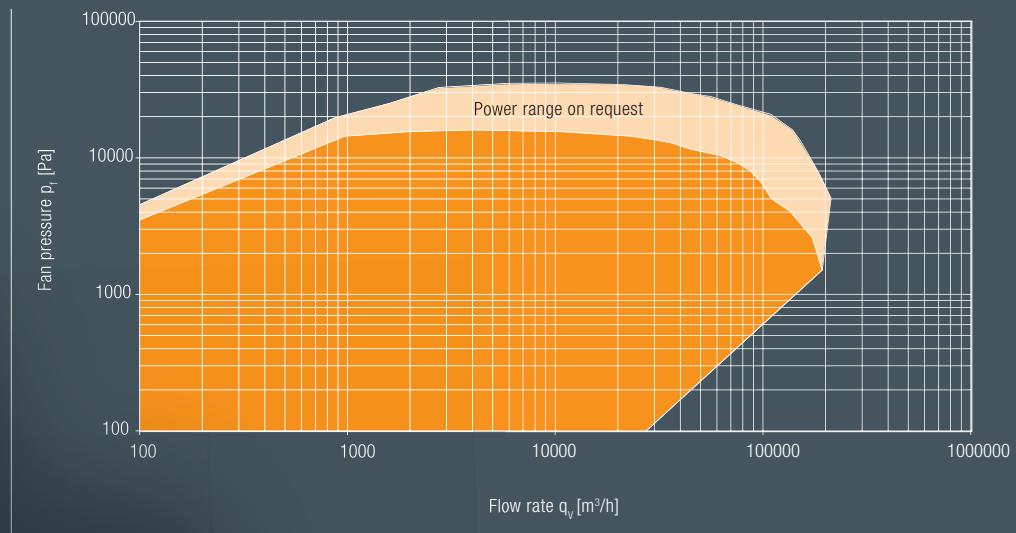

Our motors are standard equipped with PTC thermistors for operation with frequency converter (FU) with all-pole sinus filter. The maximum speed of the impeller and the maximum power output of the motor are to be observed.

Air performance curves:

Show the total pressure increase p_f as a function of the volume flow q_v for pressure-side duct connection. Power is measured at the suction chamber and ducted test rigs according to DIN 24163 and ISO 5801 for an air density of 1.2 kg / m³ and 20 °C. For the operating data of our fans tolerances are in accordance with accuracy class 2 according to DIN 24166.

Estatec by Pollrich DLK

Installation:

In different casing positions (0° , 90° , 270°), right - and left-handed available. More casing positions on request. Casing positions according to EUROVENT.

ATEX:

All fans are also available under ATEX directive.

Units:

All dimensions in this catalogue are given in mm,
Weights in kg.

Accessories:

Accessories for various installation situations,
starting at page 122.

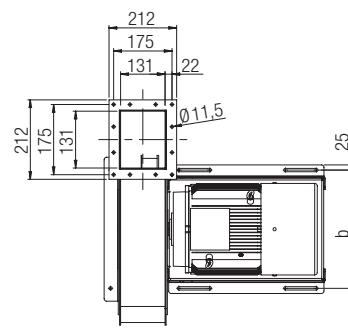

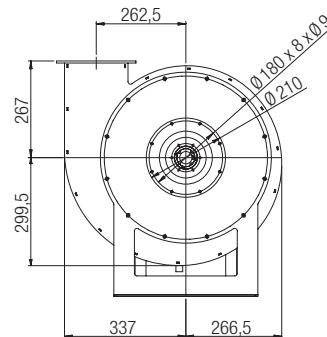

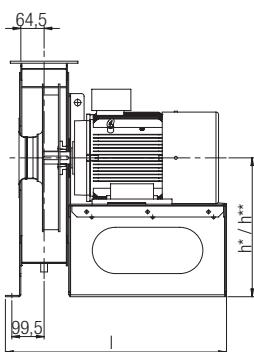

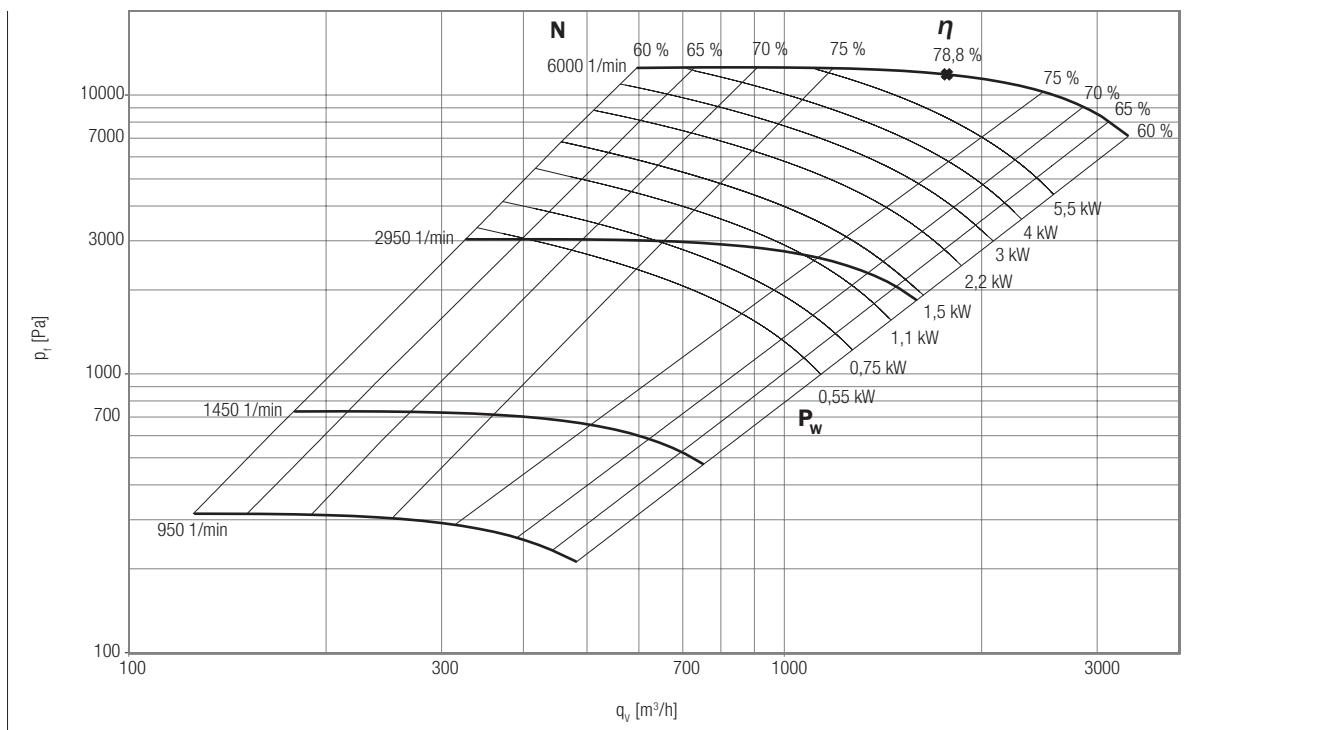

Tender Specifications:

Please refer to the Download section of our website

ACCESSORIES FOR CENTRIFUGAL FANS, DIRECT DRIVEN CREM

Z05 Protection guard

Contact protection according to DIN EN 294 Steel, powder coated RAL7015. Only required for free suction side installation situation. Supplied loose.

Z10 Flexible sleeve, round

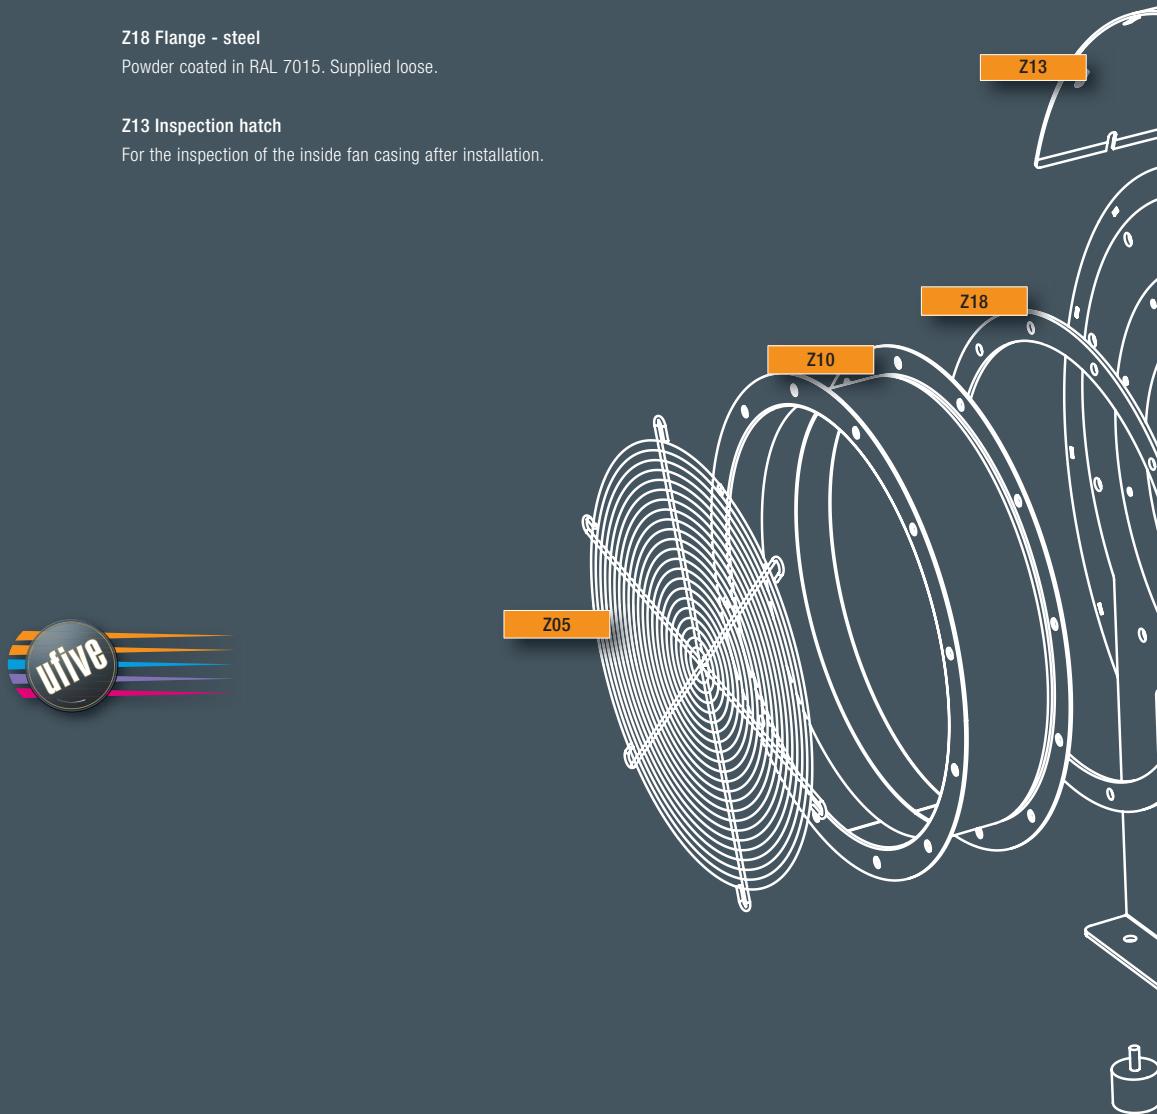

For the prevention of impact sound transmission between fan and duct system, cuff made of PVC with fabric reinforcement, including 2 angle flanges with tension bands to 80 ° C.

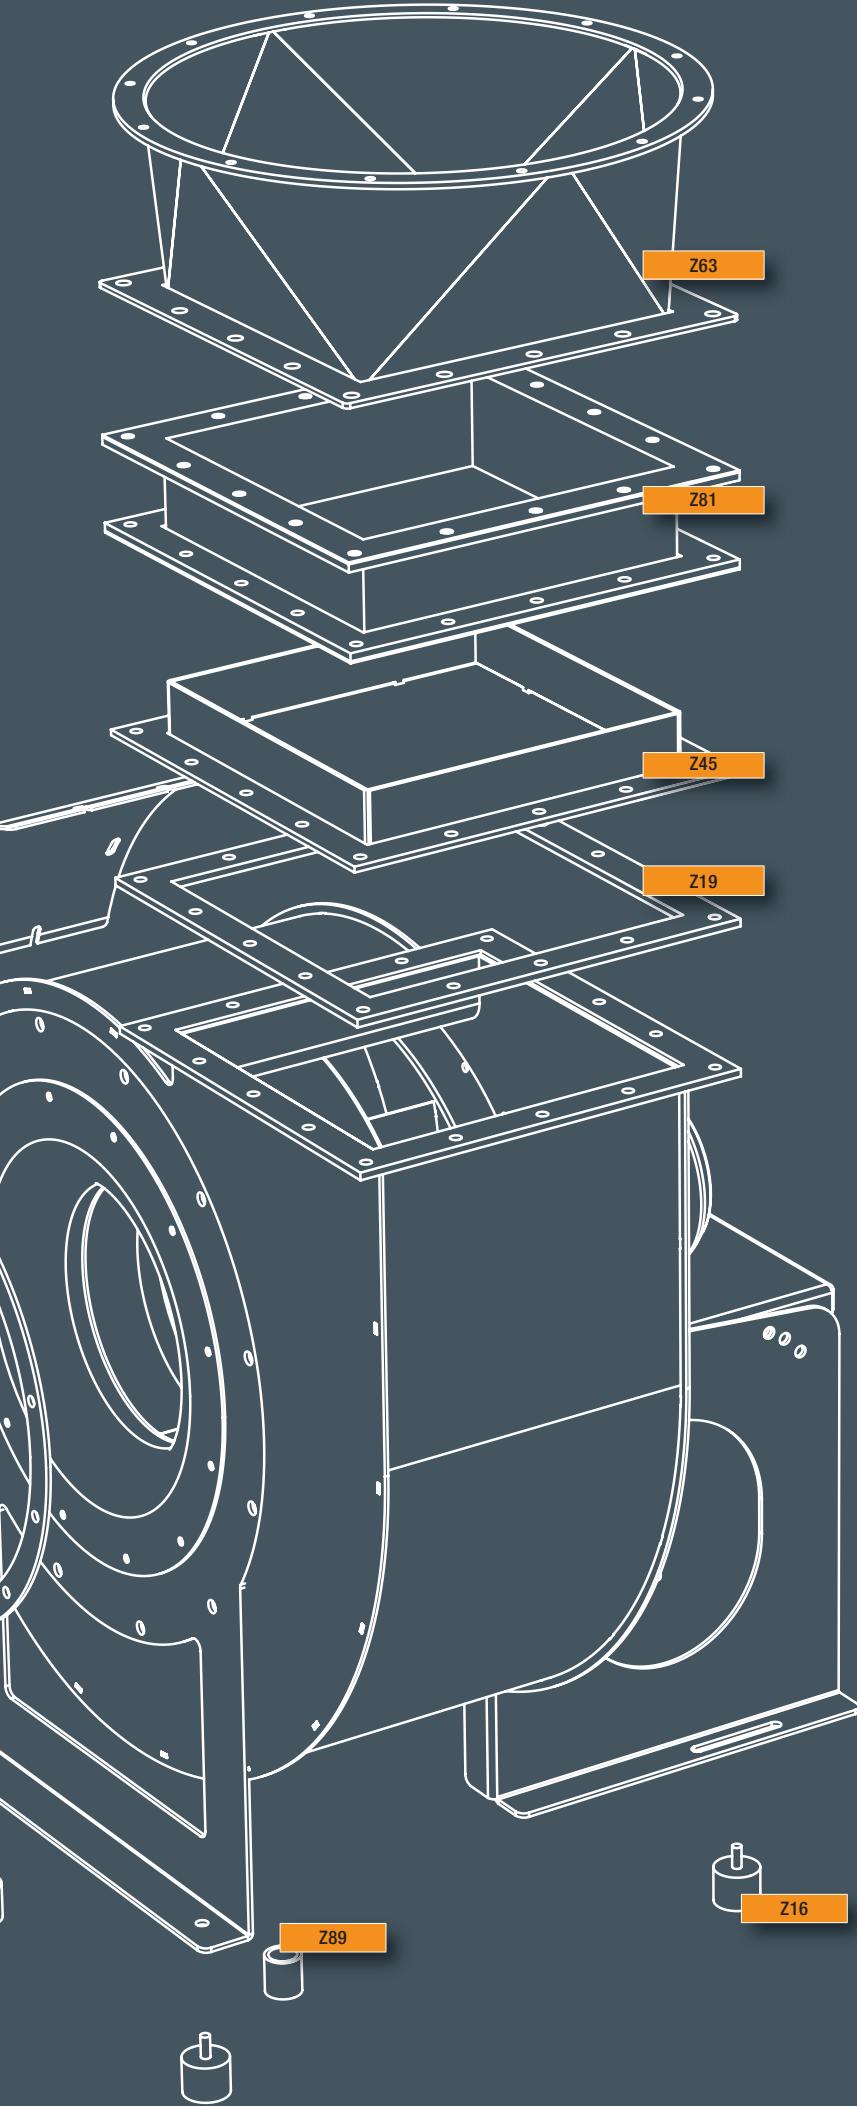

Z18 Flange - steel

Powder coated in RAL 7015. Supplied loose.

Z13 Inspection hatch

For the inspection of the inside fan casing after installation.

Z63 Transition piece

Transition piece from round to square. Connection dimensions angular adapted to the pressure side, connection dimensions round adapted to suction side. Steel, powder coated in RAL 7015. Supplied loose.

Z81 Flexible sleeve, square

For the prevention of impact sound transmission between fan and duct system, cuff made of PVC with fabric reinforcement. Incl. 2 frames for mounting. Up to 80 °C.

Z45 Flange

Steel, powder coated in RAL 7015. Supplied loose.

Z19 Steel frame

Frame. Steel, powder coated in RAL 7015. Supplied loose.

Z16 Rubber anti vibration mounts

Anti-vibration mounts for compression load. For vibration free installation of the fan on horizontal surfaces. Selection according to fan weight, approximately 55 shore A. Optional spring anti-vibration mounts (on request). Delivered loose. Amount depends on fan.

Z89 Condensate drain

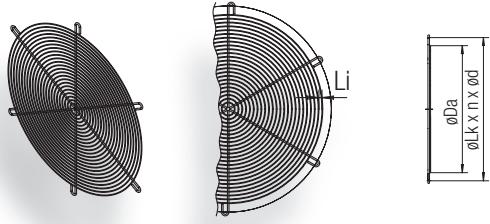

To drain the condensate that may be incurred in the fan.

ACCESSORIES

for centrifugal fans, CREM

Z63

Transition piece

Transition piece from round to square.
Connection dimensions angular adapted to
the pressure side, connection dimensions
round adapted to suction side. Steel, pow-
der coated in RAL 7015. Supplied loose.

ACCESSORIES

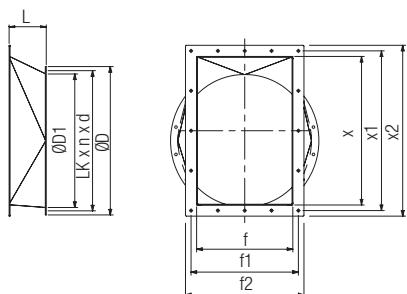

for centrifugal fans, CREM

Z81

Flexible sleeve, square

For the prevention of impact sound transmission between fan and duct system, cuff made of PVC with fabric reinforcement.

Incl. 2 frames for mounting. Up to 80 ° C.

Condensate drain

To drain the condensate that may be incurred in the fan.

... you should get to know!

CENTRIFUGAL PLUG FAN PREM

71 / 400-1120

Application:

The direct driven radial plug fans of product group PREM (Thermoplug by Pollrich DLK) can be used for ventilation of clean and slightly dusty air for various applications.

The main advantages:

- Aerodynamically optimized impellers
- High efficiency
- Compact design
- Robust design
- Easy installation
- High volume flows
- Customized solutions

Permissible flow temperature:

-20 to + 300 °C. Higher operating temperatures on request.

Casing:

Welded housing in mild steel. Optimum corrosion protection by powder coating (RAL 7015).

Optional: Hot-dip galvanizing, special coating, stainless steel.

Impeller:

High performance radial impeller, single inlet, backward curved blades.

Standard, in mild steel or stainless steel. Dynamically balanced to DIN ISO 1940-1 grade G 6.3 <4 mm / s. Optimum corrosion protection by powder coating (RAL 7015).

Optional: Increased speed with high strength materials, stainless steel, with attached or loose delivered inlet cone.

Drive:

Three-phase motor, IP55, insulation class F, IE2, up to and including 3 kW: 230V/400V, 400V/690V from 4 kW upward. Coolant temperature at motor max. 40 °C.

Thermistors wired to the motor terminal box.

Optional: Custom motor specification.

Output adjustment:

Our motors are standard equipped with PTC thermistors for operation with frequency converter (FU) with all-pole sinus filter. The maximum speed of the impeller and the max. Power output of the motor are to be observed.

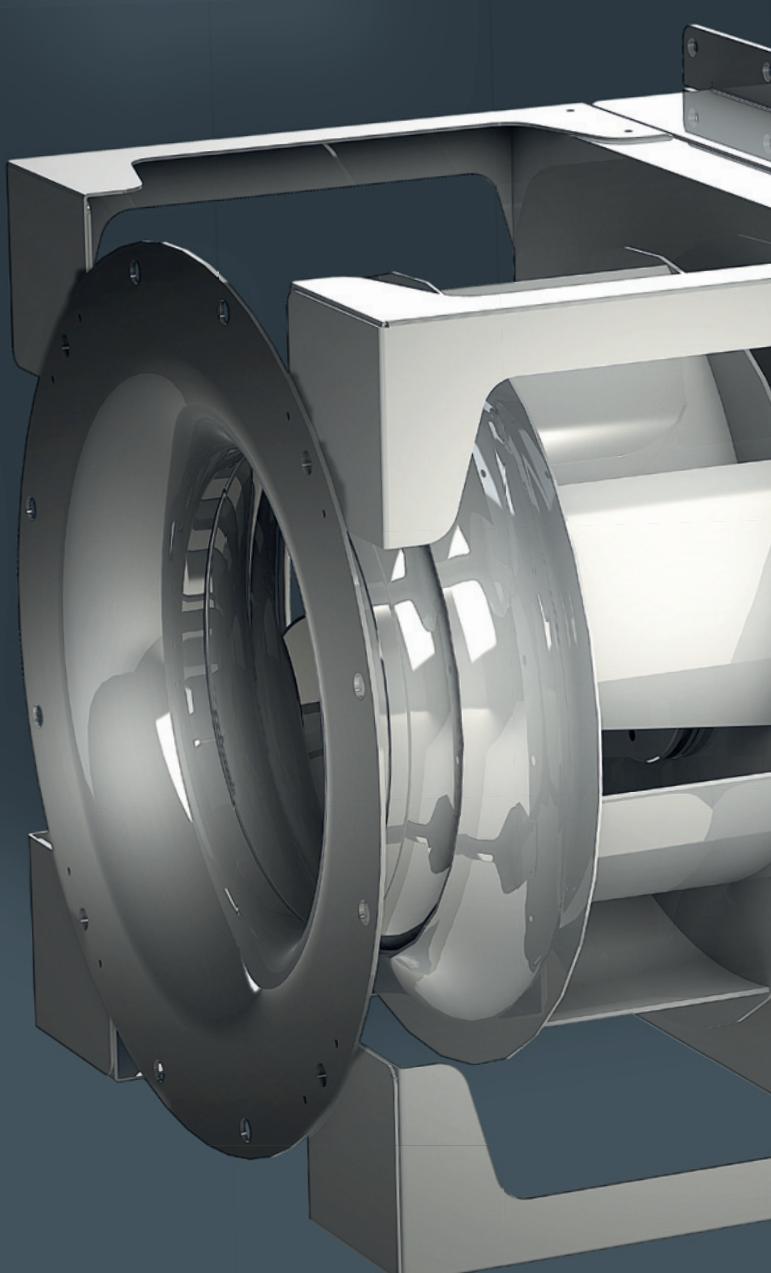

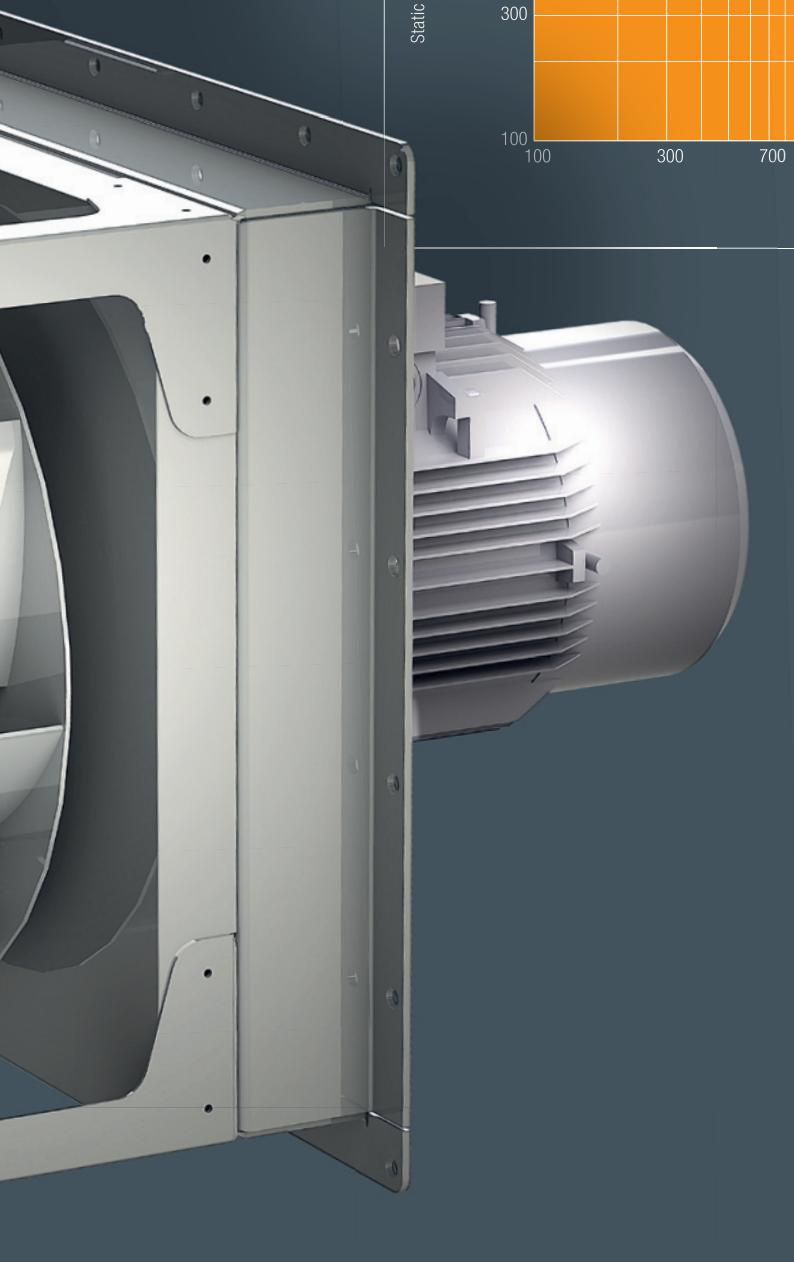

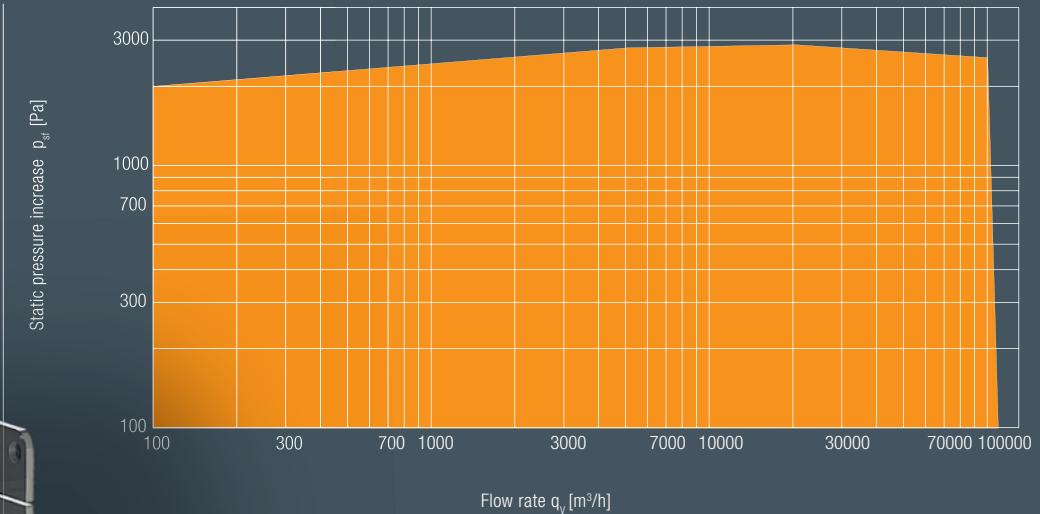

Image with accessories Z24 = Attached inlet cone

Thermoplug *by Pollrich DLK*

Air performance curves:

Show the total pressure increase p_f as a function of the volume flow q_v for pressure-side duct connection. Power is measured at the suction chamber and ducted test rigs according to DIN 24163 and ISO 5801 for an air density of 1.2 kg / m^3 and 20 °C. For the operating data of our fans tolerances are in accordance with accuracy class 2 according to DIN 24166.

ATEX:

All fans are also available under ATEX 94/9/EG Directive.

Units:

All dimensions in this catalogue are given in mm, Weights in kg.

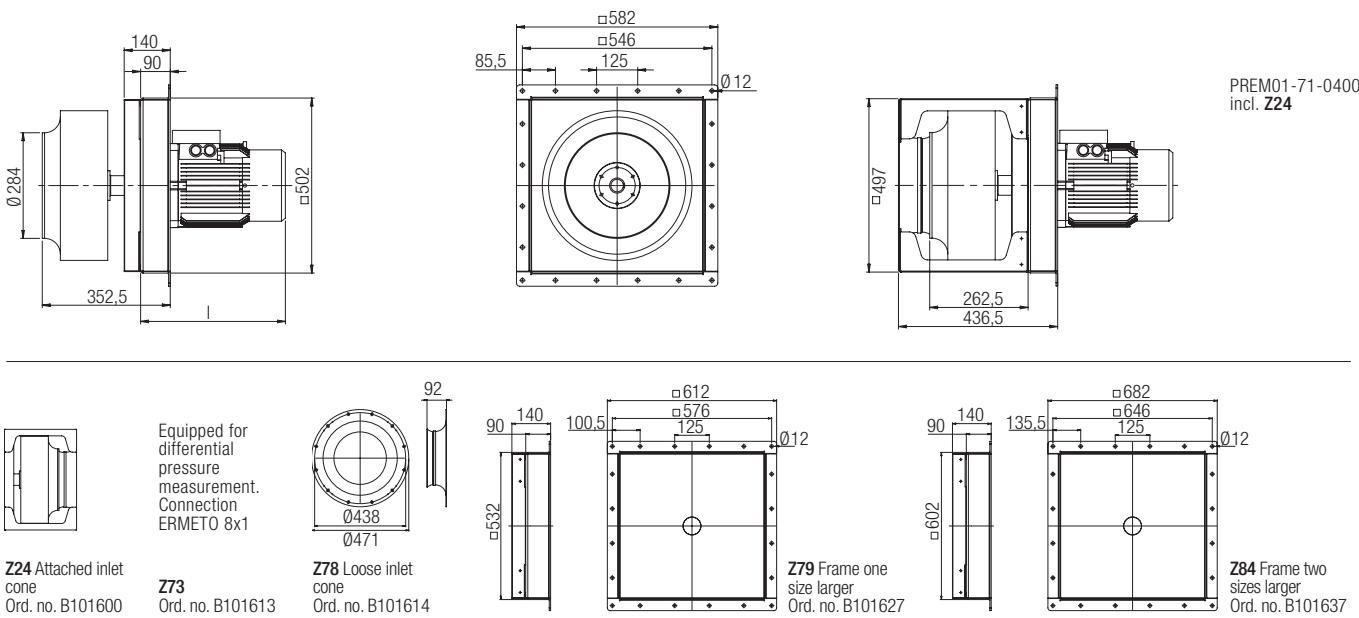

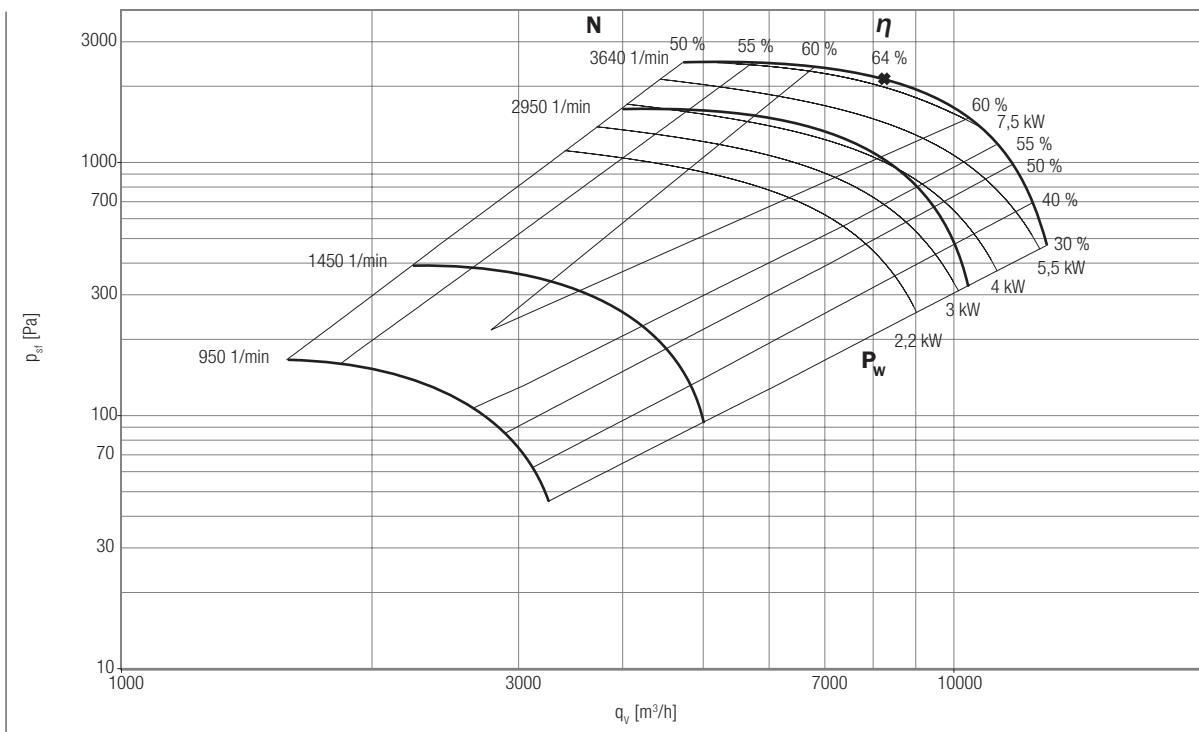

Tender Specifications:

Please refer to the Download section of our website <http://www.pollrichdlk.com>

Subject to change.
